LIQUEFACTION PROCESSES

FIELD OF THE INVENTION

The present invention relates to an improved process of liquefying dry milled starch-containing material suitable as a step in processes for producing syrups and fermentation products. The invention also relates to processes for producing ethanol comprising liquefying dry milled starch-containing starting material in accordance with the invention.

BACKGROUND OF THE INVENTION

Liquefaction is a well known process in the art by which starch is converted to shorter chains and less viscous dextrins. The process generally involves gelatinization of starch simultaneously with or followed by addition of alpha-amylase. Liquefaction is used in processes for producing syrups and fermentation products, such as ethanol. There is a need for improving the liquefaction step of converting starch into syrups and fermentation products such as especially ethanol.

SUMMARY OF THE INVENTION

The object of the present invention is to provide an improved process of liquefying dry milled starch-containing material.

The present inventors have found that liquefaction of dry milled starch-containing material may be improved by treating said dry milled starch-containing material with at least one alpha-amylase and a maltogenic amylase or alternatively with at least one amylase and at least one esterase. The esterase is believed to attack lipids present in the dry milled starch-containing material to product smaller molecules that are less likely to produce starch-lipid complexes referred to as retrograded starch. A process of the invention improves liquefaction of dry milled starch-containing material by reducing the viscosity of the gelatinized hot or warm slurry and preventing or at least reducing the formation of retrograded starch created during jet cooking. Further, according to the invention more carbohydrate is liberated from the dry milled starch-containing starting raw material.

Thus, in the first aspect the invention provides a process for liquefying dry milled starch-containing material comprising the step of treating said dry milled starch-containing material with at least one alpha-amylase and a maltogenic amylase.

In a second aspect the invention provides a process for liquefying dry milled starch-containing material comprising the step of treating said dry milled starch-containing material with at least one amylase and at least one esterase.

In one embodiment the liquefaction process comprises the steps of:

i) pre-treating a slurry of dry milled starch-containing material with at least one esterase,

ii) liquefying the pre-treated slurry with an alpha-amylase.

The liquefaction step ii) may be carried out as a multi-stage hot slurry process, such as a three stage process, carried out a different temperatures and holding times.

In the production of fermentation products, such as ethanol, and other starch-based products, such as syrups, the starch-containing raw material, such as whole grains, preferably corn, is dry milled in order to open up the structure and allow for further processing. Dry milling is well known in the art.

In another aspect the invention provides processes for producing ethanol.

In one aspect the invention provides a process for producing ethanol, comprising

(a) dry milling starch-containing material

(b) liquefying the product of step (a) with at least one alpha-amylase and at least one maltogenic amylase;

(c) saccharifying the liquefied material obtained in step (b) with a carbohydrate-source generating enzyme; and

(d) fermenting the saccharified material using a fermenting microorganism.

Step (b) may be carried out in accordance with the liquefaction process of the invention.

In another aspect the invention relates to a process for producing ethanol, comprising:

(a) dry milling starch-containing material

(b) liquefying the product of step (a) with at least one amylase and at least one esterase;

(c) saccharifying the liquefied material obtained in step (b) with a carbohydrate-generating enzyme; and

(d) fermenting the saccharified material using a fermenting microorganism.

Step (b) may be carried out in accordance with the liquefaction process of the invention.

The invention also provides a process for producing ethanol, comprising

(a) dry milling starch-containing material

(b) i) pre-treating a slurry of said dry milled starch-containing material with at least one esterase, and

ii) liquefying the pre-treated slurry with an alpha-amylase;

(c) saccharifying the liquefied material obtained in step (b) with a carbohydrate-generating enzyme; and,

(d) fermenting the saccharified material using a fermenting microorganism.

Steps (b) and (c) may be carried out in accordance with the liquefaction process of the invention.

DESCRIPTION OF THE INVENTION

The present invention provides an improved liquefaction process suitable as a step in processes for producing, e.g., syrups and fermentation products. As a result of the process of the invention formation of retrograded starch is prevented or at least reduced and thus more carbohydrates are liberated from the dry milled starch-containing starting raw material.

Dry milling processes are well-known in the art and generally involve the step of grinding/milling starch-containing material, such as whole cereal grains, in a dry or substantially dry state. For ethanol production the dry milling generally includes the main steps of grinding/milling whole cereal grains to produce a meal, and subjecting the meal to liquefaction, saccharification, fermentation and optionally distillation.

The starting material is generally selected based on the desired fermentation product and the process employed. Examples of starting material suitable for use in a process of the present invention, include starch-containing raw materials, such as tubers, roots, whole grains, corns, cobs, wheat, barley, rye, milo or cereals, sugar-containing raw materials, such as molasses, fruit materials, sugar, cane or sugar beet, potatoes, and cellulose-containing materials, such as wood or plant residues. Starch-containing whole corn grains are the preferred raw starting material for the liquefaction and ethanol production processes of the invention.

Liquefaction

The present inventors have found that liquefaction of dry milled starch-containing material may be improved by treating dry milled starch-containing material with at least one alpha-amylase and a maltogenic amylase or alternatively with at least one amylase and at least one esterase.

Thus, in the first aspect the invention provides a process for liquefying dry milled starch-containing material comprising the step of treating said dry milled starch-containing material with at least one alpha-amylase and a maltogenic amylase.

According to the second aspect the invention provides a process for liquefying dry milled starch-containing material comprising the step of treating dry milled starch-containing material with at least one amylase and at least one esterase.

Without being limited to any theory it is believed that the treatment with a combination of amylase and esterase reduces the formation of retrograded starch. The esterase is believed

to attack lipids present in dry milled starch-containing material, e.g., corn, to produce smaller molecules that are less likely to produce starch-lipid complexes referred to as retrograded starch which are created during jet cooking. Further, esterase catalyze a reaction between dendrimer and soluble starch chains occurring at the oil inter-phase to form a new architecture that prevents the formation of the lipid-starch complex during jet cooking and liquefaction. It may also reduce the amount of amylase needed to carry out liquefaction.

According to the present invention "liquefaction" is a process in which dry milled starch-containing material, preferably (whole) grain raw material, is broken down (hydrolyzed) into maltodextrins (dextrins). According to the invention liquefaction may be carried out by heating the slurry of 20-40 wt-%, preferably 25-35 wt-% dry milled starch-containing material and water to between 20-105°C, preferably 60-95°C and adding the enzymes to initiate liquefaction (thinning). The slurry may then be jet-cooked at a temperature between 95-140°C, preferably 105-125°C to complete gelatinization of the slurry. Then the slurry is cooled to 60-95°C and more enzyme(s) is(are) added to finalize hydrolysis (secondary liquefaction).

In one embodiment of the invention the liquefaction is carried out as a multi-stage process, such as a three-stage process, where the first stage is performed at a temperature in the range from 80 to 105ºC, the second stage at a temperature in the range between 65 to 95ºC, and the third stage at a temperature between 40-75ºC.

In a preferred embodiment three stages are carried out at the following temperature stages: a first stage: 80-95ºC, a second stage: 75-85ºC, and third stage: 60 to 70ºC. According to the invention the holding time for the first stage may be from 10 to 90 minutes, 30-120 minutes for the second stage, and 30-120 minutes for the third stage.

A liquefaction process of the invention may typically be carried out at pH 4.5-6.5, in particular at a pH between 5 and 6. Milled and liquefied whole grains are known as mash.

The amylase may be any amylase, preferred an amylase mentioned in the section "Amylases" below. In a preferred embodiment the amylase is an alpha-amylase and/or a maltogenic amylase. The esterase may be any esterase, preferably an esterase mentioned in the section "Esterases". Preferred esterases are lipases, phospholipases, and cutinases, or mixtures thereof. A liquefaction process of the invention or a pre-treatment step of the invention may be carried out in the presence of a fatty acid oxidizing enzyme, preferably a lipoxygenase, as will be defined further below in the section "Fatty acid oxidizing enzymes".

In one embodiment the liquefaction process comprises the steps of:

i) pre-treating a slurry of dry milled starch-containing material with at least one esterase, and

ii) liquefying the pre-treated slurry with an alpha-amylase.

As mentioned above the liquefaction may be carried out as a three-stage hot slurry process. In an embodiment of the invention the esterase is used together with a maltogenic amylase during the pre-treatment. In another embodiment an esterase, a maltogenic amylase, and an alpha-amylase is present during pre-treatment. In a further embodiment an esterase, a maltogenic amylase and carbohydrate-source generating enzymes, such as a glucoamylase and optionally a fungal acid alpha-amylase is present during pre-treatment.

In another embodiment of the process of the invention the dry milled starch-containing material is liquefied by treatment with an esterase, maltogenic amylase and/or an alpha-amylase without or without pre-treatment.

In a preferred embodiment the pre-treatment is carried out by subjecting an aqueous slurry of dry milled starch-containing material to an esterase, preferably a lipase, a maltogenic amylase and an alpha-amylase, preferably an acid amylase, such as a fungal acid alpha-amylase followed by liquefaction with an alpha-amylase.

The process is preferably carried out in aqueous hot slurry at a temperature in the range from 20-105°C, preferably 60-95°C.

Ethanol process

Ethanol production processes of the invention generally involve the steps of dry milling, liquefaction, saccharification, fermentation and optionally distillation. In the production of ethanol the starch-containing raw material, such as whole grains, preferably corn, is dry milled in order to open up the structure and allow for further processing.

In one aspect the invention provides a process for producing ethanol, comprising

(a) dry milling starch-containing material

(b) liquefying the product of step (a) with at least one alpha-amylase and at least one maltogenic amylase;

(c) saccharifying the liquefied material obtained in step (b) with a carbohydrate-source generating enzyme; and

(d) fermenting the saccharified material using a fermenting microorganism.

Step (b) may be carried out in accordance with the liquefaction process of the invention.

In another aspect the invention provides a process for producing ethanol, comprising

(a) dry milling starch-containing material;

(b) liquefying the product of step (a) with at least one amylase and at least one esterase;

(c) saccharifying the liquefied material obtained in step (b) with a carbohydrate-generating enzyme; and

(d) fermenting the saccharified material using a fermenting microorganism.

Step (b) may be carried out in accordance with the liquefaction process of the invention.

In yet another aspect the invention provides a process for producing ethanol, comprising

(a) dry milling starch-containing material

(b) i) pre-treating a slurry of said dry milled starch-containing material with at least one esterase,

ii) liquefying the pre-treated slurry with an alpha-amylase.

(c) saccharifying the liquefied material obtained in step (b) with a carbohydrate-generating enzyme; and

(d) fermenting the saccharified material using a fermenting microorganism.

Steps (b) and (c) are carried out in accordance with the liquefaction process of the invention.

The fermentation step may be followed by an optional distillation step.

Saccharification

"Saccharification" is a step in which the maltodextrin (such as, product from the liquefaction process) is converted to low molecular sugars DP_{1-3} (i.e., carbohydrate source) that can be metabolized by a fermenting organism, such as, yeast. Saccharification steps are well known in the art and are typically performed enzymatically using at least a glucoamylase or one or more carbohydrate-source generating enzymes. The saccharification step in the process for producing ethanol of the invention may be a well known saccharification step in the art. In one embodiment glucoamylase, alpha-glucosidases and/or acid alpha-amylase is used for treating the liquefied starch-containing material. A full saccharification step may last up to from about 24 to about 72 hours, and is often carried out at temperatures from about 30 to 65°C, and at a pH between 4 and 5, normally at about pH 4.5. However, it is often more preferred to do a pre-saccharification step, lasting for about 40 to 90 minutes, at temperature of between 30-65°C, typically about 60°C, followed by complete saccharification during fermentation in a simultaneous saccharification and fermentation process (SSF). The most widely used process in ethanol production is the simultaneous saccharification and fermentation (SSF) process, in which there is no holding stage for the saccharification, meaning that fermenting organism, such as yeast, and enzyme(s) is(are) added together. In SSF processes, it is common to introduce a pre-saccharification step at a temperature above 50°C, just prior to the fermentation.

Fermentation

In ethanol production, the fermenting organism is preferably yeast, which is applied to the saccharified mash. "Fermenting organism" refers to any organism suitable for use in a de-

sired fermentation process. Suitable fermenting organisms are according to the invention able to ferment, i.e., convert, sugars, such as glucose or maltose, directly or indirectly into the desired fermentation product. Examples of fermenting microorganisms include fungal organisms, such as yeast. Preferred yeast includes strains of the *Sacchromyces* spp., and in particular, *Sacchromyces cerevisiae.* Commercially available yeast includes, e.g., Red Star®/Lesaffre Ethanol Red (available from Red Star/Lesaffre, USA) FALI (available from Fleischmann's Yeast, a division of Burns Philp Food Inc., USA), SUPERSTART (available from Alltech), GERT STRAND (available from Gert Strand AB, Sweden) and FERMIOL (available from DSM Specialties). In preferred embodiments, yeast is applied to the mash and the fermentation is ongoing for 24-96 hours, such as typically 35-60 hours. In preferred embodiments, the temperature is generally between 26-34°C, in particular about 32°C, and the pH is generally from pH 3-6, preferably around pH 4-5. Yeast cells are preferably applied in amounts of 10^5 to 10^{12}, preferably from 10^7 to 10^{10}, especially $5x10^7$ viable yeast count per ml of fermentation broth. During the ethanol producing phase the yeast cell count should preferably be in the range from 10^7 to 10^{10}, especially around 2 x 10^8. Further guidance in respect of using yeast for fermentation can be found in, e.g., "The alcohol Textbook" (Editors K. Jacques, T.P. Lyons and D.R.Kelsall, Nottingham University Press, United Kingdom 1999), which is hereby incorporated by reference.

Distillation

Following fermentation, the mash may be distilled to extract the alcohol product (ethanol). In the case where the end product is ethanol it may be used as, e.g., fuel ethanol; drinking ethanol, i.e., potable neutral spirits; or industrial ethanol.

Starch Conversion

The liquefaction process of the invention may also be included in a traditional starch conversion process for producing syrups such as glucose, maltose, malto-oligosaccharides and isomalto-oligosaccharides.

Amylases

Suitable amylases include alpha-amylases, beta-amylases and maltogenic amylases, or mixtures thereof.

Alpha-amylases

According to the invention preferred alpha-amylases are of fungal or bacterial origin.

In an embodiment the alpha-amylase is a *Bacillus* alpha-amylase, such as, derived from a strain of *B. licheniformis, B. amyloliquefaciens, and B. stearothermophilus.* Other alpha-

amylases include alpha-amylase derived from a strain of the *Bacillus* sp. NCIB 12289, NCIB 12512, NCIB 12513 or DSM 9375, all of which are described in detail in WO 95/26397, and the alpha-amylase described by Tsukamoto et al., Biochemical and Biophysical Research Communications, 151 (1988), pp. 25-31. Other alpha-amylase variants and hybrids are described in WO 96/23874, WO 97/41213, and WO 99/19467. Other alpha-amylase includes alpha-amylases derived from a strain *of Aspergillus*, such as, *Aspergillus oryzae* and *Aspergillus niger* alpha-amylases. In a preferred embodiment, the alpha-amylase is an acid alpha-amylase. In a more preferred embodiment the acid alpha-amylase is an acid fungal alpha-amylase or an acid bacterial alpha-amylase. More preferably, the acid alpha-amylase is an acid fungal alpha-amylase derived from the genus *Aspergillus*. A commercially available acid fungal amylase is SP288 (available from Novozymes A/S, Denmark).

In an embodiment the alpha-amylase is an acid alpha-amylase. The term "acid alpha-amylase" means an alpha-amylase (E.C. 3.2.1.1) which added in an effective amount has activity at a pH in the range of 3.0 to 7.0, preferably from 3.5 to 6.0, or more preferably from 4.0-5.0.

A preferred acid fungal alpha-amylase is a Fungamyl-like alpha-amylase. In the present disclosure, the term "Fungamyl-like alpha-amylase" indicates an alpha-amylase which exhibits a high homology, i.e. more than 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85% 90%, 95 or even 99% identical to the amino acid sequence shown in SEQ ID NO: 10 in WO 96/23874. When used as a maltose generating enzyme fungal alpha-amylases may be added in an amount of 0.001-1.0 AFAU/g DS, preferably from 0.002-0.5 AFAU/g DS, preferably 0.02-0.1 AFAU/g DS.

Preferably the alpha-amylase is an acid alpha-amylase, preferably from the genus *Aspergillus*, preferably of the species *Aspergillus niger*. In a preferred embodiment the acid fungal alpha-amylase is the one from *A. niger* disclosed as "AMYA_ASPNG" in the Swiss-prot/TeEMBL database under the primary accession no. P56271. Also variant of set acid fungal amylase having at least 70% identity, such as at least 80% or even at least 90% identity thereto is contemplated.

A preferred acid alpha-amylase for use in the present invention may be derived from a strain of *B. licheniformis*, *B. amyloliquefaciens*, and *B. stearothermophilus*. The alpha-amylase may also be an alpha-amylase variant. Specifically contemplated alpha-amylase variants are disclosed in US patent no. 6,297,038 and US patent no. 6,187,576 (hereby incorporated by reference).

Preferred commercial compositions comprising an alpha-amylase include MYCOLASE™ from DSM; BAN™, TERMAMYL™ SC, FUNGAMYL™, LIQUOZYME™ X and SAN™ SUPER, SAN™ EXTRA L from Novozymes A/S, Denmark) and CLARASE™ L-40,000, DEX-LO™, SPEYME FRED, SPEZYME™ AA, and SPEZYME™ DELTA AA (Genencor Int., USA), and the

acid fungal alpha-amylase sold under the trade name SP 288 (available from Novozymes A/S, Denmark).

The alpha-amylase may be added in amounts as are well-known in the art. When measured in AAU units the acid alpha-amylase activity is preferably present in an amount of 5-50,0000 AAU/kg of DS, in an amount of 500-50,000 AAU/kg of DS, or more preferably in an amount of 100-10,000 AAU/kg of DS, such as 500-1,000 AAU/kg DS. Fungal acid alpha-amylase are preferably added in an amount of 10-10,000 AFAU/kg of DS, in an amount of 500-2,500 AFAU/kg of DS, or more preferably in an amount of 100-1,000 AFAU/kg of DS, such as approximately 500 AFAU/kg DS.

Maltogenic amylase

The amylase may also be a maltogenic alpha-amylase. A "maltogenic alpha-amylase" (glucan 1,4-alpha-maltohydrolase, E.C. 3.2.1.133) is able to hydrolyze amylose and amylopectin to maltose in the alpha-configuration. A maltogenic alpha-amylase from *Bacillus stearothermophilus* strain NCIB 11837 is commercially available from Novozymes A/S under the tradename MALTOGENASE™. Maltogenic alpha-amylases are described in US Patent nos. 4,598,048, 4,604,355 and 6,162,628, which are hereby incorporated by reference.

Esterases

As used herein, an "esterase" also referred to as a carboxylic ester hydrolyases, refers to enzymes acting on ester bonds, and includes enzymes classified in EC 3.1.1 Carboxylic Ester Hydrolases according to Enzyme Nomenclature (available at http://www.chem.qmw.ac.uk/iubmb/enzyme or from Enzyme Nomenclature 1992, Academic Press, San Diego, California, with Supplement 1 (1993), Supplement 2 (1994), Supplement 3 (1995), Supplement 4 (1997) and Supplement 5, in Eur. J. Biochem. 1994, 223, 1-5; Eur. J. Biochem. 1995, 232, 1-6; Eur. J. Biochem. 1996, 237, 1-5; Eur. J. Biochem. 1997, 250; 1-6, and Eur. J. Biochem. 1999, 264, 610-650; respectively). Non-limiting examples of esterases include arylesterase, triacylglycerol lipase, acetylesterase, acetylcholinesterase, cholinesterase, tropinesterase. pectinesterase, sterol esterase, chlorophyllase, L-arabinonolactonase, gluconolactonase, uronolactonase, tannase, retinyl-palmitate esterase, hydroxybutyrate-dimer hydrolase, acylglycerol lipase, 3-oxoadipate enol-lactonase, 1,4-lactonase, galactolipase, 4-pyridoxolactonase, acylcarnitine hydrolase, aminoacyl-tRNA hydrolase, D-arabinonolactonase, 6-phosphogluconolactonase, phospholipase A1, 6-acetylglucose deacetylase, lipoprotein lipase, dihydrocoumarin lipase, limonin-D-ring-lactonase, steroid-lactonase, triacetate-lactonase, actinomycin lactonase, orsellinate-depside hydrolase, cephalosporin-C deacetylase, chlorogenate hydrolase, alpha-amino-acid esterase, 4-methyloxaloacetate esterase, carboxymethylenebu-

tenolidase, deoxylimonate A-ring-lactonase, 2-acetyl-1-alkylglycerophosphocholine esterase, fusarinine-C ornithinesterase, sinapine esterase, wax-ester hydrolase, phorbol-diester hydrolase, phosphatidylinositol deacylase, sialate O-acetylesterase, acetoxybutynylbithiophene deacetylase, acetylsalicylate deacetylase, methylumbelliferyl-acetate deacetylase, 2-pyrone-4,6-dicarboxylate lactonase, N-acetylgalactosaminoglycan deacetylase, juvenile-hormone esterase, bis(2-ethylhexyl)phthalate esterase, protein-glutamate methylesterase, 11-cis-retinyl-palmitate hydrolase, all-trans-retinyl-palmitate hydrolase, L-rhamnono-1,4-lactonase, 5-(3,4-diacetoxybut-1-ynyl)-2,2'-bithiophene deacetylase, fatty-acyl-ethyl-ester synthase, xylono-1,4-lactonase, N-acetylglucosaminylphosphatidylinositol deacetylase, cetraxate benzylesterase, acetylalkylglycerol acetylhydrolase, and acetylxylan esterase.

Preferred esterases for use in the present invention are lipolytic enzymes, such as, lipases (as classified by EC 3.1.1.3, EC 3.1.1.23 and/or EC 3.1.1.26) and phospholipases (as classified by EC 3.1.1.4 and/or EC 3.1.1.32, including lysophospholipases as classified by EC 3.1.1.5). Other preferred esterases are cutinases (as classified by EC 3.1.1.74).

Examples of effective amounts of esterase are from 0.01 to 400 LU/g DS (Dry Solids). Preferably, the esterase is used in an amount of 0.1 to 100 LU/g DS, more preferably 0.5 to 50 LU/g DS, and even more preferably 1 to 20 LU/g DS. Further optimization of the amount of esterase can hereafter be obtained using standard procedures known in the art.

In a preferred embodiment the esterase is a lipolytic enzyme, more preferably, a lipase. As used herein, a "lipolytic enzymes" refers to lipases and phospholipases (including lysophospholipases). The lipolytic enzyme is preferably of microbial origin, in particular of bacterial, fungal or yeast origin. The lipolytic enzyme used may be derived from any source, including, for example, a strain of *Absidia*, in particular *Absidia* blakesleena and *Absidia* corymbifera, a strain of Achromobacter, in particular *Achromobacter iophagus*, a strain of *Aeromonas*, a strain of *Alternaria*, in particular *Alternaria brassiciola*, a strain of Aspergillus, in particular Aspergillus niger and *Aspergillus flavus*, a strain of *Achromobacter*, in particular *Achromobacter iophagus*, a strain of *Aureobasidium*, in particular *Aureobasidium pullulans*, a strain of *Bacillus*, in particular *Bacillus pumilus*, *Bacillus strearothermophilus* and *Bacillus subtilis*, a strain of *Beauveria*, a strain of *Brochothrix*, in particular *Brochothrix thermosohata*, a strain of *Candida*, in particular *Candida cylindracea* (*Candida rugosa*), *Candida paralipolytica*, and *Candida antarctica*, a strain of *Chromobacter*, in particular *Chromobacter viscosum*, a strain of *Coprinus*, in particular *Coprinus cinerius*, a strain of *Fusarium*, in particular *Fusarium oxysporum*, *Fusarium solani*, *Fusarium solani pisi*, and *Fusarium roseum culmorum*, a strain of *Geotricum*, in particular *Geotricum penicillatum*, a strain of *Hansenula*, in particular *Hansenula anomala*, a strain of *Humicola*, in particular *Humicola brevispora*, *Humicola brevis var. thermoidea*, and *Humicola insolens*, a strain of *Hyphozyma*, a strain of *Lactobacillus*, in particular *Lactobacillus curvatus*, a strain of

Metarhizium, a strain of *Mucor*, a strain of *Paecilomyces*, a strain of *Penicillium*, in particular *Penicillium cyclopium*, Penicillium crustosum and *Penicillium expansum*, a strain of *Pseudomonas* in particular *Pseudomonas aeruginosa*, *Pseudomonas alcaligenes*, *Pseudomonas cepacia* (syn. *Burkholderia cepacia*), *Pseudomonas fluorescens*, *Pseudomonas fragi*, *Pseudomonas maltophilia*, *Pseudomonas mendocina*, *Pseudomonas* mephitica lipolytica, *Pseudomonas alcaligenes*, Pseudomonas plantari, *Pseudomonas pseudoalcaligenes*, *Pseudomonas putida*, *Pseudomonas stutzeri*, and *Pseudomonas wisconsinensis*, a strain of *Rhizoctonia*, in particular *Rhizoctonia solani*, a strain of *Rhizomucor*, in particular *Rhizomucor miehei*, a strain of *Rhizopus*, in particular *Rhizopus japonicus*, *Rhizopus microsporus* and *Rhizopus nodosus*, a strain of *Rhodosporidium*, in particular *Rhodosporidium toruloides*, a strain of *Rhodotorula*, in particular *Rhodotorula glutinis*, a strain of *Sporobolomyces*, in particular *Sporobolomyces shibatanus*, a strain of *Thermomyces*, in particular *Thermomyces lanuginosus* (formerly *Humicola lanuginosa*), a strain of *Thiarosporella*, in particular *Thiarosporella phaseolina*, a strain of *Trichoderma*, in particular *Trichoderma harzianum*, and *Trichoderma reesei*, and/or a strain of *Verticillium*.

In a preferred embodiment, the lipolytic enzyme is derived from a strain of *Aspergillus*, a strain of *Achromobacter*, a strain of *Bacillus*, a strain of *Candida*, a strain of *Chromobacter*, a strain of *Fusarium*, a strain of *Humicola*, a strain of *Hyphozyma*, a strain of *Pseudomonas*, a strain of *Rhizomucor*, a strain of *Rhizopus*, or a strain of *Thermomyces*.

In more preferred embodiments, the lipolytic enzyme is a lipase. Lipases may be applied herein for their ability to modify the structure and composition of triglyceride oils and fats in the fermentation media (including fermentation yeast), for example, resulting from a corn substrate. Lipases catalyze different types of triglyceride conversions, such as hydrolysis, esterification and transesterification. Suitable lipases include acidic, neutral and basic lipases, as are well-known in the art, although acidic lipases (such as, e.g., the lipase G AMANO 50, available from Amano) appear to be more effective at lower concentrations of lipase as compared to either neutral or basic lipases. Preferred lipases for use in the present invention included Candida antarcitca lipase and *Candida cylindracea* lipase. More preferred lipases are purified lipases such as *Candida antarcitca* lipase (lipase A), *Candida antarcitca* lipase (lipase B), *Candida cylindracea* lipase, and *Penicillium camembertii* lipase.

The lipase the one disclosed in EP 258,068-A or may be a lipase variant such as a variant disclosed in WO 00/60063 or WO 00/32758 which is hereby incorporated by reference. Preferred commercial lipases include LECITASE™, LIPOLASE™, LIPEX™ and NOVOZYM® 735 (available from Novozymes A/S, Denmark) and G AMANO™ 50 (available from Amano).

Lipases are preferably added in amounts from about 1 to 400 LU/g DS, preferably 1 to 10 LU/g DS, and more preferably 1 to 5 LU/g DS.

In another preferred embodiment of the present invention, the at least one esterase is a cutinase. Cutinases are enzymes which are able to degrade cutin. The cutinase may be derived from any source. In a preferred embodiment, the cutinase is derived from a strain of Aspergillus, in particular *Aspergillus oryzae*, a strain of *Alternaria*, in particular Alternaria brassiciola, a strain of *Fusarium*, in particular *Fusarium solani*, *Fusarium solani pisi*, *Fusarium roseum culmorum*, or *Fusarium roseum sambucium*, a strain of Helminthosporum, in particular Helminthosporum sativum, a strain of *Humicola*, in particular *Humicola insolens*, a strain of *Pseudomonas*, in particular *Pseudomonas mendocina*, or *Pseudomonas putida*, a strain of Rhizoctonia, in particular *Rhizoctonia solani*, a strain of *Streptomyces*, in particular *Streptomyces scabies*, or a strain of *Ulocladium*, in particular *Ulocladium consortiale*. In a most preferred embodiment the cutinase is derived from a strain of *Humicola insolens*, in particular the strain *Humicola insolens* DSM 1800. *Humicola insolens* cutinase is described in WO 96/13580 which is herby incorporated by reference. The cutinase may be a variant such as one of the variants disclosed in WO 00/34450 and WO 01/92502 which is hereby incorporated by reference. Preferred cutinase variants include variants listed in Example 2 of WO 01/92502 which are hereby specifically incorporated by reference. An effective amount of cutinase is between 0.01 and 400 LU/g DS, preferably from about 0.1 to 100 LU/g DS, more preferably, 1 to 50 LU/g DS. Further optimization of the amount of cutinase can hereafter be obtained using standard procedures known in the art.

In another preferred embodiment, the at least one esterase is a phospholipase. As used herein, the term phospholipase is an enzyme which has activity towards phospholipids. Phospholipids, such as lecithin or phosphatidylcholine, consist of glycerol esterified with two fatty acids in an outer (sn-1) and the middle (sn-2) positions and esterified with phosphoric acid in the third position; the phosphoric acid, in turn, may be esterified to an amino-alcohol. Phospholipases are enzymes which participate in the hydrolysis of phospholipids. Several types of phospholipase activity can be distinguished, including phospholipases A_1 and A_2 which hydrolyze one fatty acyl group (in the sn-1 and sn-2 position, respectively) to form lysophospholipid; and lysophospholipase (or phospholipase B) which can hydrolyze the remaining fatty acyl group in lysophospholipid. Phospholipase C and phospholipase D (phosphodiesterases) release diacyl glycerol or phosphatidic acid respectively.

The term phospholipase includes enzymes with phospholipase activity, e.g., phospholipase A (A_1 or A_2), phospholipase B activity, phospholipase C activity or phospholipase D activity. The term "phospholipase A" used herein in connection with an enzyme of the invention is intended to cover an enzyme with Phospholipase A_1 and/or Phospholipase A_2 activity. The phospholipase activity may be provided by enzymes having other activities as well, such as, e.g., a lipase with phospholipase activity. The phospholipase activity may, e.g., be from a lipase

with phospholipase side activity. In other embodiments of the invention the phospholipase enzyme activity is provided by an enzyme having essentially only phospholipase activity and wherein the phospholipase enzyme activity is not a side activity.

The phospholipase may be of any origin, e.g., of animal origin (such as, e.g., mammalian), e.g., from pancreas (e.g. bovine or porcine pancreas), or snake venom or bee venom. Alternatively, the phospholipase may be of microbial origin, e.g., from filamentous fungi, yeast or bacteria, such as the genus or species *Aspergillus,* e.g., *A. niger; Dictyostelium*, e.g., *D. discoideum; Mucor*, e.g., *M. javanicus, M. mucedo, M. subtilissimus; Neurospora*, e.g. *N. crassa; Rhizomucor*, e.g., *R. pusillus; Rhizopus*, e.g. *R. arrhizus, R. japonicus, R. stolonifer; Sclerotinia*, e.g., *S. libertiana; Trichophyton*, e.g. T. rubrum; Whetzelinia, e.g. W. sclerotiorum; Bacillus, e.g., *B. megaterium, B. subtilis*; *Citrobacter*, e.g., *C. freundii*; *Enterobacter*, e.g., *E. aerogenes, E. cloacae Edwardsiella, E. tarda*; *Erwinia*, e.g., *E. herbicola*; *Escherichia*, e.g., *E. coli*; *Klebsiella*, e.g., *K. pneumoniae*; *Proteus*, e.g., *P. vulgaris*; *Providencia*, e.g. *P. stuartii*; *Salmonella*, e.g. S. typhimurium; Serratia, e.g., *S. liquefasciens, S. marcescens*; *Shigella*, e.g., *S. flexneri*; *Streptomyces*, e.g., *S. violeceoruber*; Yersinia, e.g., *Y. enterocolitica*. Thus, the phospholipase may be fungal, e.g., from the class *Pyrenomycetes*, such as the genus *Fusarium*, such as a strain of *F. culmorum, F. heterosporum, F. solani*, or a strain of *F. oxysporum*. The phospholipase may also be from a filamentous fungus strain within the genus *Aspergillus*, such as a strain of *Aspergillus awamori, Aspergillus foetidus, Aspergillus japonicus, Aspergillus niger* or *Aspergillus oryzae*. Preferred commercial phospholipases include LECITASE™ and LECITASE™ ULTRA (available from Novozymes A/S, Denmark).

An effective amount of phosphorlipase is between 0.01 and 400 LU/g DS, preferably from about 0.1 to 100 LU/g DS, more preferably, 1 to 50 LU/g DS. Further optimization of the amount of phosphorlipase can hereafter be obtained using standard procedures known in the art.

Fatty acid oxidizing enzymes

The term "fatty acid oxidizing enzyme" means at least one of such enzymes.

In the present context, a "fatty acid oxidizing enzyme" is an enzyme which hydrolyzes the substrate linoleic acid more efficiently than the substrate syringaldazine. "More efficiently" means with a higher reaction rate. This can be tested using the method described in Example 2 of WO 03/035972 (hereby incorporated by reference), and calculating the difference between (1) absorbancy increase per minute on the substrate linoleic acid (absorbancy at 234 nm), and (2) absorbancy increase per minute on the substrate syringaldazine (absorbancy at 530 nm), i.e., by calculating the Reaction Rate Difference (RRD) = $(d(A_{234})/dt - d(A_{530})/dt)$. If the RRD is

above zero, the enzyme in question qualifies as a fatty acid oxidizing enzyme as defined herein. If the RRD is zero, or below zero the enzyme in question is not a fatty acid oxidizing enzyme.

In particular embodiments, the RRD is at least 0.05, 0.10, 0.15, 0.20, or at least 0.25 absorbancy units/minute.

In a particular embodiment the enzymes are well-defined. Still further, for the method of Example 2 of WO 03/035972 the enzyme dosage is adjusted so as to obtain a maximum absorbancy increase per minute at 234 nm, or at 530 nm. In particular embodiments, the maximum absorbancy increase is within the range of 0.05-0.50; 0.07-0.4; 0.08-0.3; 0.09-0.2; or 0.10-0.25 absorbancy units pr. min. The enzyme dosage may for example be in the range of 0.01-20; 0.05-15; or 0.10-10 mg enzyme protein per ml.

In the alternative, a "fatty acid oxidizing enzyme" may be defined as an enzyme capable of oxidizing unsaturated fatty acids more efficiently than syringaldazine. The activity of the enzyme could be compared in a standard oximeter setup as described in Example 1 of the present application at pH 6 and 30°C including either syringaldazine or linoleic acid as substrates.

In a particular embodiment, the fatty acid oxidizing enzyme is defined as an enzyme classified as EC 1.11.1.3, or as EC 1.13.11.-. EC 1.13.11.- means any of the sub-classes thereof, presently forty-nine: EC 1.13.11.1-EC 1.13.11.49. EC 1.11.1.3 is designated fatty acid peroxidase, and EC 1.13.11.- is designated oxygenases acting on single donors with incorporation of two atoms of oxygen.

In a further particular embodiment, the EC 1.13.11.- enzyme is classified as EC 1.13.11.12, EC 1.13.11.31, EC 1.13.11.33, EC 1.13.11.34, EC 1.13.11.40, EC 1.13.11.44 or EC 1.13.11.45, designated lipoxygenase, arachidonate 12-lipoxygenase, arachidonate 15-lipoxygenase, arachidonate 5-lipoxygenase, arachidonate 8-lipoxygenase, linoleate diol synthase, and linoleate 11-lipoxygenase, respectively).

Examples of effective amounts of fatty acid oxidizing enzyme are from 0.001 to 400 U/g DS (Dry Solids). Preferably, the fatty acid oxidizing enzyme is used in an amount of 0.01 to 100 U/g DS, more preferably 0.05 to 50 U/g DS, and even more preferably 0.1 to 20 U/g DS. Further optimization of the amount of fatty acid oxidizing enzyme can hereafter be obtained using standard procedures known in the art.

Lipoxygenase

In a preferred embodiment, the fatty acid oxidizing enzyme is a lipoxygenase (LOX), classified as EC 1.13.11.12, which is an enzyme that catalyzes the oxygenation of polyunsatu-

rated fatty acids, especially *cis,cis*-1,4-dienes, e.g., linoleic acid and produces a hydroperoxide. But also other substrates may be oxidized, e.g. monounsaturated fatty acids.

Microbial lipoxygenases can be derived from, e.g., *Saccharomyces cerevisiae*, *Thermoactinomyces vulgaris*, *Fusarium oxysporum*, *Fusarium proliferatum*, *Thermomyces lanuginosus*, *Pyricularia oryzae*, and strains of *Geotrichum*. The preparation of a lipoxygenase derived from *Gaeumannomyces graminis* is described in Examples 3-4 of WO 02/20730. The expression in *Aspergillus oryzae* of a lipoxygenase derived from *Magnaporthe salvinii* is described in Example 2 of WO 02/086114, and this enzyme can be purified using standard methods, e.g. as described in Example 4 of WO 02/20730.

Lipoxygenase (LOX) may also be extracted from plant seeds, such as soybean, pea, chickpea, and kidney bean. Alternatively, lipoxygenase may be obtained from mammalian cells, e.g., rabbit reticulocytes.

Lipoxygenase activity may be determined as described in the "Materials and Methods" section.

Examples of effective amounts of lipoxygenase (LOX) are from 0.001 to 400 U/g DS (Dry Solids). Preferably, the lipoxygenase is used in an amount of 0.01 to 100 U/g DS, more preferably 0.05 to 50 U/g DS, and even more preferably 0.1 to 20 U/g DS. Further optimization of the amount of lipoxygenase can hereafter be obtained using standard procedures known in the art.

Carbohydrate-Source Generating Enzyme

The term "carbohydrate-source generating enzyme" includes glucoamylases (being a glucose generators), and beta-amylases and maltogenic amylases (being maltose generators). A carbohydrate-source generating enzyme is capable of providing energy to the fermenting microorganism(s) used in a process of the invention for producing ethanol and/or may be converting directly or indirectly to a desired fermentation product, preferably ethanol. The carbohydrate-source generating enzyme may be mixtures of enzymes falling within the definition. Especially contemplated mixtures are mixtures of at least a glucoamylase and an alpha-amylase, especially an acid amylase, even more preferred an acid fungal alpha-amylase. The ratio between acidic fungal alpha-amylase activity (AFAU) per glucoamylase activity (AGU) (AFAU per AGU) may in an embodiment of the invention be at least 0.1, in particular at least 0.16, such as in the range from 0.12 to 0.50.

Examples of contemplated glucoamylases, alpha-amylases and beta-amylases are set forth in the sections below.

It is to be understood that the enzymes used according to the invention should be added in effective amounts.

Glucoamylase

A glucoamylase used according to the invention may be derived from any suitable source, e.g., derived from a microorganism or a plant. Preferred glucoamylases are of fungal or bacterial origin, selected from the group consisting of *Aspergillus* glucoamylases, in particular *A. niger* G1 or G2 glucoamylase (Boel et al. (1984), EMBO J. 3 (5), p. 1097-1102), or variants thereof, such as disclosed in WO 92/00381, WO 00/04136 add WO 01/04273 (from Novozymes, Denmark); the *A. awamori* glucoamylase (WO 84/02921), *A. oryzae* (Agric. Biol. Chem. (1991), 55 (4), p. 941-949), or variants or fragments thereof.

Other *Aspergillus* glucoamylase variants include variants to enhance the thermal stability: G137A and G139A (Chen et al. (1996), Prot. Eng. 9, 499-505); D257E and D293E/Q (Chen et al. (1995), Prot. Engng. 8, 575-582); N182 (Chen et al. (1994), Biochem. J. 301, 275-281); disulphide bonds, A246C (Fierobe et al. (1996), Biochemistry, 35, 8698-8704; and introduction of Pro residues in position A435 and S436 (Li et al. (1997), Protein Engng. 10, 1199-1204. Other glucoamylases include *Athelia rolfsii* (previously denoted *Corticium rolfsii*) glucoamylase (see US patent no. 4,727,026 and (Nagasaka,Y. et al. (1998) Purification and properties of the raw-starch-degrading glucoamylases from *Corticium rolfsii*, Appl Microbiol Biotechnol 50:323-330), *Talaromyces* glucoamylases, in particular, derived from *Talaromyces emersonii* (WO 99/28448), *Talaromyces leycettanus* (US patent no. Re. 32,153), *Talaromyces duponti, Talaromyces thermophilus* (US patent no. 4,587,215). Bacterial glucoamylases contemplated include glucoamylases from the genus *Clostridium*, in particular *C. thermoamylolyticum* (EP 135,138), and *C. thermohydrosulfuricum* (WO 86/01831).

Commercially available compositions comprising glucoamylase include AMG 200L; AMG 300 L; SAN™ SUPER, SAN™ EXTRA L, SPIRIZYME™ PLUS, SPIRIZYME™ FUEL, SPIRIZYME™ B4U and AMG™ E (from Novozymes A/S); OPTIDEX™ 300 (from Genencor Int.); AMIGASE™ and AMIGASE™ PLUS (from DSM); G-ZYME™ G900, G-ZYME™ and G990 ZR (from Genencor Int.).

Glucoamylases may in an embodiment be added in an amount of 0.02-20 AGU/g DS, preferably 0.1-10 AGU/g DS, such as 2 AGU/g DS.

Beta-amylase

At least according to the invention the a beta-amylase (E.C 3.2.1.2) is the name traditionally given to exo-acting maltogenic amylases, which catalyze the hydrolysis of 1,4-alpha-glucosidic linkages in amylose, amylopectin and related glucose polymers. Maltose units are successively removed from the non-reducing chain ends in a step-wise manner until the molecule is degraded or, in the case of amylopectin, until a branch point is reached. The maltose released has the beta anomeric configuration, hence the name beta-amylase.

Beta-amylases have been isolated from various plants and microorganisms (W.M. Fogarty and C.T. Kelly, Progress in Industrial Microbiology, vol. 15, pp. 112-115, 1979). These beta-amylases are characterized by having optimum temperatures in the range from 40°C to 65°C and optimum pH in the range from 4.5 to 7. A commercially available beta-amylase from barley is NOVOZYM™ WBA from Novozymes A/S, Denmark and SPEZYME™ BBA 1500 from Genencor Int., USA.

Production of Enzymes

The enzymes referenced herein may be derived or obtained from any suitable origin, including, bacterial, fungal, yeast or mammalian origin. The term "derived" or means in this context that the enzyme may have been isolated from an organism where it is present natively, i.e., the identity of the amino acid sequence of the enzyme are identical to a native enzyme. The term "derived" also means that the enzymes may have been produced recombinantly in a host organism, the recombinant produced enzyme having either an identity identical to a native enzyme or having a modified amino acid sequence, e.g., having one or more amino acids which are deleted, inserted and/or substituted, i.e., a recombinantly produced enzyme which is a mutant and/or a fragment of a native amino acid sequence or an enzyme produced by nucleic acid shuffling processes known in the art. Within the meaning of a native enzyme are included natural variants. Furthermore, the term "derived" includes enzymes produced synthetically by, e.g., peptide synthesis. The term "derived" also encompasses enzymes which have been modified e.g., by glycosylation, phosphorylation, or by other chemical modification, whether in vivo or in vitro. The term "obtained" in this context means that the enzyme has an amino acid sequence identical to a native enzyme. The term encompasses an enzyme that has been isolated from an organism where it is present natively, or one in which it has been expressed recombinantly in the same type of organism or another, or enzymes produced synthetically by, e.g., peptide synthesis. With respect to recombinantly produced enzymes the terms "obtained" and "derived" refers to the identity of the enzyme and not the identity of the host organism in which it is produced recombinantly.

The enzymes may also be purified. The term "purified" as used herein covers enzymes

free from other components from the organism from which it is derived. The term "purified" also covers enzymes free from components from the native organism from which it is obtained. The enzymes may be purified, with only minor amounts of other proteins being present. The expression "other proteins" relate in particular to other enzymes. The term "purified" as used herein also refers to removal of other components, particularly other proteins and most particularly other enzymes present in the cell of origin of the enzyme of the invention. The enzyme may be "substantially pure," that is, free from other components from the organism in which it is produced, that is, for example, a host organism for recombinantly produced enzymes. In preferred embodiment, the enzymes are at least 75% (w/w) pure, more preferably at least 80%, at least 85%, at least 90%, at least 95%, at least 96%, at least 97%, at least 98%, or at least 99% pure. In another preferred embodiment, the enzyme is 100% pure.

The enzymes used according to the present invention may be in any form suitable for use in the processes described herein, such as, e.g., in the form of a dry powder or granulate, a non-dusting granulate, a liquid, a stabilized liquid, or a protected enzyme. Granulates may be produced, e.g., as disclosed in US Patent Nos. 4,106,991 and US 4,661,452, and may optionally be coated by process known in the art. Liquid enzyme preparations may, for instance, be stabilized by adding stabilizers such as a sugar, a sugar alcohol or another polyol, lactic acid or another organic acid according to established process. Protected enzymes may be prepared according to the process disclosed in EP 238,216.

Even if not specifically mentioned in context of a process of the invention, it is to be understood that the enzyme(s) or agent(s) is(are) used in an "effective amount".

MATERIALS AND METHODS

Enzymes:

Alpha-amylase A: *Bacillus stearothermophilus* alpha-amylase variant with the mutations: I181*+G182*+N193F disclosed in US patent no. 6,187,576 and available on request from Novozymes A/S, Denmark.

Maltogenic amylase A: Maltogenic amylase derived from *Bacillus stearothermophilus* strain NCIB 11837 disclosed in US patent no. 4,598,048 and available on request from Novozymes A/S, Denmark.

Stock solution for iodine method:

0.1N I_2

· dissolve 1.3 g I_2 and 2.0 g KI into 100 mL DI water

Methods:

Alpha-amylase activity (KNU)

The amylolytic activity may be determined using potato starch as substrate. This method is based on the break-down of modified potato starch by the enzyme, and the reaction is followed by mixing samples of the starch/enzyme solution with an iodine solution. Initially, a blackish-blue color is formed, but during the break-down of the starch the blue color gets weaker and gradually turns into a reddish-brown, which is compared to a colored glass standard.

One Kilo Novo alpha amylase Unit (KNU) is defined as the amount of enzyme which, under standard conditions (i.e. at 37°C +/- 0.05; 0.0003 M Ca^{2+}; and pH 5.6) dextrinizes 5260 mg starch dry substance Merck Amylum solubile.

A folder EB-SM-0009.02/01 describing this analytical method in more detail is available upon request to Novozymes A/S, Denmark, which folder is hereby included by reference.

Determination of FAU activity

One Fungal Alpha-Amylase Unit (FAU) is defined as the amount of enzyme, which breaks down 5.26 g starch (Merck Amylum solubile Erg. B.6, Batch 9947275) per hour based upon the following standard conditions:

Substrate . . . . . Soluble starch
Temperature . . . . . 37°C
PH. 4.7
Reaction time . . . . 7-20 minutes

Determination of acid alpha-amylase activity (AFAU)

Acid alpha-amylase activity is measured in AFAU (Acid Fungal Alpha-amylase Units), which are determined relative to an enzyme standard.

The standard used is AMG 300 L (from Novozymes A/S, Denmark, glucoamylase wild-type Aspergillus niger G1, also disclosed in Boel et al. (1984), EMBO J. 3 (5), p. 1097-1102) and WO 92/00381). The neutral alpha-amylase in this AMG falls after storage at room temperature for 3 weeks from approx. 1 FAU/mL to below 0.05 FAU/mL.

The acid alpha-amylase activity in this AMG standard is determined in accordance with the following description. In this method, 1 AFAU is defined as the amount of enzyme, which degrades 5.260 mg starch dry matter per hour under standard conditions.

Iodine forms a blue complex with starch but not with its degradation products. The intensity of color is therefore directly proportional to the concentration of starch. Amylase activity is determined using reverse colorimetry as a reduction in the concentration of starch under specified analytic conditions.

	Alpha-amylase	
Starch + Iodine	→	Dextrins + Oligosaccharides
	40°C, pH 2.5	
Blue/violet	t=23 sec.	Decoloration

Standard conditions/reaction conditions: (per minute)

Substrate:	Starch, approx. 0.17 g/L
Buffer:	Citate, approx. 0.03 M
Iodine (I_2):	0.03 g/L
$CaCl_2$:	1.85 mM
pH:	2.50 ± 0.05
Incubation temperature:	40°C
Reaction time:	23 seconds
Wavelength:	lambda=590nm
Enzyme concentration:	0.025 AFAU/mL
Enzyme working range:	0.01-0.04 AFAU/mL

If further details are preferred these can be found in EB-SM-0259.02/01 available on request from Novozymes A/S, Denmark, and incorporated by reference.

Acid Alpha-amylase Units (AAU)

The acid alpha-amylase activity can be measured in AAU (Acid Alpha-amylase Units), which is an absolute method. One Acid Amylase Unit (AAU) is the quantity of enzyme converting 1 g of starch (100% of dry matter) per hour under standardized conditions into a product having a transmission at 620 nm after reaction with an iodine solution of known strength equal to the one of a color reference.

Standard conditions/reaction conditions:

Substrate:	Soluble starch. Concentration approx. 20 g DS/L.
Buffer:	Citrate, approx. 0.13 M, pH=4.2

Iodine solution:	40.176 g potassium iodide + 0.088 g iodine/L
City water	15°-20°dH (German degree hardness)
pH:	4.2
Incubation temperature:	30°C
Reaction time:	11 minutes
Wavelength:	620nm
Enzyme concentration:	0.13-0.19 AAU/mL
Enzyme working range:	0.13-0.19 AAU/mL

The starch should be Lintner starch, which is a thin-boiling starch used in the laboratory as colorimetric indicator. Lintner starch is obtained by dilute hydrochloric acid treatment of native starch so that it retains the ability to color blue with iodine. Further details can be found in EP0140410B2, which disclosure is hereby included by reference.

Glucoamylase activity (AGI)

Glucoamylase (equivalent to amyloglucosidase) converts starch into glucose. The amount of glucose is determined here by the glucose oxidase method for the activity determination. The method described in the section 76-11 Starch—Glucoamylase Method with Subsequent Measurement of Glucose with Glucose Oxidase in "Approved methods of the American Association of Cereal Chemists". Vol.1-2 AACC, from American Association of Cereal Chemists, (2000); ISBN: 1-891127-12-8.

One glucoamylase unit (AGI) is the quantity of enzyme which will form 1 micromol of glucose per minute under the standard conditions of the method.

Standard conditions/reaction conditions:

Substrate:	Soluble starch.
	Concentration approx. 16 g dry matter/L.
Buffer:	Acetate, approx. 0.04 M, pH=4.3
pH:	4.3
Incubation temperature:	60°C
Reaction time:	15 minutes
Termination of the reaction:	NaOH to a concentration of approximately
	0.2 g/L (pH~9)
Enzyme concentration:	0.15-0.55 AAU/mL

The starch should be Lintner starch, which is a thin-boiling starch used in the laboratory as colorimetric indicator. Lintner starch is obtained by dilute hydrochloric acid treatment of native starch so that it retains the ability to color blue with iodine.

Glucoamylase activity (AGU)

The Novo Glucoamylase Unit (AGU) is defined as the amount of enzyme, which hydrolyzes 1 micromole maltose per minute under the standard conditions 37°C, pH 4.3, substrate: maltose 23.2 mM, buffer: acetate 0.1 M, reaction time 5 minutes.

An autoanalyzer system may be used. Mutarotase is added to the glucose dehydrogenase reagent so that any alpha-D-glucose present is turned into beta-D-glucose. Glucose dehydrogenase reacts specifically with beta-D-glucose in the reaction mentioned above, forming NADH which is determined using a photometer at 340 nm as a measure of the original glucose concentration.

AMG incubation:	
Substrate:	maltose 23.2 mM
Buffer:	acetate 0.1 M
pH:	4.30 ± 0.05
Incubation temperature:	37°C ± 1
Reaction time:	5 minutes
Enzyme working range:	0.5-4.0 AGU/mL

Color reaction:	
GlucDH:	430 U/L
Mutarotase:	9 U/L
NAD:	0.21 mM
Buffer:	phosphate 0.12 M; 0.15 M NaCl
pH:	7.60 ± 0.05
Incubation temperature:	37°C ± 1
Reaction time:	5 minutes
Wavelength:	340 nm

A folder (EB-SM-0131.02/01) describing this analytical method in more detail is available on request from Novozymes A/S, Denmark, which folder is hereby included by reference.

Cutinase activity (LU)

The cutinase activity is determined as lipolytic activity determined using tributyrine as substrate. This method was based on the hydrolysis of tributyrin by the enzyme, and the alkali consumption is registered as a function of time. One Lipase Unit (LU) is defined as the amount of enzyme which, under standard conditions (i.e. at 30.0°C; pH 7.0; with Gum Arabic as emulsifier and tributyrine as substrate) liberates 1 micro mol titrable butyric acid per minute. A folder AF 95/5 describing this analytical method in more detail is available upon request from Novozymes A/S, Denmark, which folder is hereby included by reference.

Lipoxygenase activity

Lipoxygenase activity is determined spectrophotometrically at 25°C by monitoring the formation of hydroperoxides. For the standard analysis, 10 micro liters enzyme is added to a 1 ml quartz cuvette containing 980 micro liter 25 mM sodium phosphate buffer (pH 7.0) and 10 micro liter of substrate solution (10 mM linoleic acid dispersed with 0.2%(v/v) Tween20 (should not be kept for extended time periods)). The enzyme is typically diluted sufficiently to ensure a turn-over of maximally 10% of the added substrate within the first minute. The absorbance at 234 nm is followed and the rate is estimated from the linear part of the curve. The *cis-trans*-conjugated hydro(pero)xy fatty acids are assumed to have a molecular extinction coefficient of 23,000 $M^{-1}cm^{-1}$.

Standard iodine method

- boil small aliquot (10-20 mLs) of liquefied material in a test tube for several minutes
- cool in ice bath
- add 10-12 drops of the iodine solution
- mix and let sample sit in ice water for about 10 minutes

EXAMPLES

Example 1

Liquefaction with an alpha-amylase and a maltogenic amylase

Alpha-amylase A and maltogenic amylase A were added to a slurry of dry milled ground corn (30% solids), heated to 85°C and held for 2 hours. The physical effects from this system were compared to the liquefaction done with only alpha-amylase A.

The mash made with alpha-amylase A and maltogenic amylase A showed less retrograded starch using the standard iodine method as well as being less viscous.

CLAIMS

1. A process for liquefying dry milled starch-containing material comprising the step of treating said dry milled starch-containing material with at least one alpha-amylase and a maltogenic amylase.

2. A process for liquefying dry milled starch-containing material comprising the step of treating said dry milled starch-containing material with at least one amylase and at least one esterase.

3. The process of claim 2, wherein the liquefaction comprise the steps of :

i) pre-treating a slurry of said dry milled starch-containing material with at least one esterase, and

ii) liquefying the pre-treated slurry with at least one alpha-amylase.

4. The process of claim 3, wherein further a maltogenic amylase is present during pre-treatment.

5. The process of claim 2, wherein the pre-treatment is carried out by subjecting the slurry of dry milled starch-containing milled material with an esterase, preferably a lipase, a maltogenic amylase and an alpha-amylase, preferably an acid amylase, such as a fungal acid alpha-amylase.

6. The process of claim 3, wherein the amylase is a maltogenic amylase and/or an alpha-amylase.

7. The process of claim 1, wherein the liquefaction is carried out in multi-stages, such as three stages, preferably a first stage at a temperature in the range from 80 to 105°C, a second stage at a temperature in the range between 65 to 95°C, and a third stage at a temperature between 40-75°C.

8. The process of claim 7, wherein the multi stage liquefaction is carries out at the following temperature stages: a first stage: 80-95°C, a second stage: 75-85°C, and third stage: 60 to 70°C.

9. The process of claims 7 or 8, wherein the holding time for stage one is 10 to 90 minutes, 30-120 minutes for the second stage and 30-120 minutes for the third stage.

10. The process of any of claims 1 to 9, wherein the dry milled starch-containing material is treated with an esterase and a maltogenic amylase and/or an alpha-amylase.

11. The process of any of claims 1 to 10, wherein the dry milled starch-containing material is dry milled whole grains, preferably dry milled corn, wheat, barley, or milo.

12. The process of any of claims 1 to 11, wherein the amylase or maltogenic amylase is of bacterial origin, preferably a strain of the genus *Bacilllus,* especially *Bacillus stearothermophilus.*

13. The process of any of claim 2 to 12, wherein the esterase is a lipase, phospholipase, or a cutinase, or a combination thereof.

14. The process of any of claims 1 to 13, wherein liquefaction is carried out in the presence of a fatty acid oxidizing enzyme, preferably a lipoxygenase.

15. The process of any of claim 1 to 14, wherein the (pre-)treatment is carried out in an aqueous slurry at a temperature in the range from 20-105°C, preferably 60-95°C.

16. A process for producing ethanol, comprising

(a) dry milling starch-containing material;

(b) liquefying the product of step (a) with at least one alpha-amylase and at least one maltogenic amylase as defined in claim 1;

(c) saccharifying the liquefied material obtained in step (b) with a carbohydrate-source generating enzyme; and

(d) fermenting the saccharified material using a fermenting microorganism.

17. A process for producing ethanol, comprising

(a) dry milling starch-containing material;

(b) liquefying the product of step (a) with at least one amylase and at least one esterase;

(c) saccharifying the liquefied material obtained in step (b) with a carbohydrate-source generating enzyme; and

(d) fermenting the saccharified material using a fermenting microorganism.

18. A process for producing ethanol, comprising

(a) dry milling starch-containing material

(b) i) pre-treating a slurry of said dry milled starch-containing material with at least one esterase,

ii) liquefying the pre-treated slurry with an alpha-amylase;

(c) saccharifying the liquefied material obtained in step (b) with a carbohydrate-source generating enzyme; and

(d) fermenting the saccharified material using a fermenting microorganism.

19. The process of any of claims 16 to 18, wherein step b) and c) is carried out as a simultaneous saccharification and fermentation step (SSF).

20. The process of any of claims 16 to 18, wherein the dry milled starch-containing material, is whole grains, preferably corn, wheat, barley, or milo.

21. The process of claim 18, wherein the pre-treatment in step (b) i) is further carried out in the presence of a maltogenic amylase.

22. The process of claims 16 to 21, wherein the carbohydrate-source generating enzyme is a glucoamylase or an alpha-amylase of mixtures thereof, preferably in mixture of acidic fungal alpha-amylase activity (AFAU) per glucoamylase activity (AGU) (AFAU per AGU) of at least 0.1, in particular at least 0.16, such as in the range from 0.12 to 0.50.

23. The process of any of claims 16 to 22, further comprising distilling the fermented material.

24. The process of any of claims 16 to 23, wherein said fermenting microorganism is yeast.

25. The process of the claims 16 to 24, wherein the treatment or pre-treatment is carried out in aqueous slurry at a temperature in the range from 20-105ºC, preferably 60-95°C.

26. The process of any of claims 18 to 25, wherein further a maltogenic amylase is present during pre-treatment.

27. The process of any of claims 18 to 26, wherein the pre-treatment is carried out by subjecting the slurry of dry milled starch-containing milled material with an esterase, preferably a lipase, a maltogenic amylase and an alpha-amylase, preferably an acid amylase, such as a fungal acid alpha-amylase.

28. The process of claim 18 to 27, wherein the amylase is a maltogenic amylase and/or an alpha-amylase.

29. The process of any of claims 16 to 28, wherein the liquefaction is carried out in multi-stages, such as three stages, preferably a first stage at a temperature in the range from 80 to 105°C, a second stage at a temperature in the range between 65 to 95, and a third stage at a temperature between 40-75°C.

30. The process of claim 29, wherein the multi stage liquefaction is carries out at the following temperature stages: a first stage: 80-95°C, a second stage: 75-85°C, and third stage: 60 to 70°C.

31. The process of claims 29 or 30, wherein the holding time for stage one is 10 to 90 minutes, 30-120 minutes for the second stage and 30-120 minutes for the third stage.

32. The process of any of claims 16 to 31, wherein the dry milled starch-containing material is treated with an esterase and a maltogenic amylase and/or an alpha-amylase.

33. The process of any of claims 16 to 32, wherein the dry milled starch-containing material is dry milled whole grains, preferably dry milled corn, wheat, barley, or milo.

34. The process of any of claims 16 to 33, wherein the amylase or maltogenic amylase is of bacterial origin, preferably a strain of the genus *Bacilllus,* especially *Bacillus stearothermophilus.*

35. The process of any of claim 17 to 34, wherein the esterase is a lipase, phospholipase, or a cutinase, or a combination thereof.

36. The process of any of claims 16-35, wherein liquefaction is carried out in the presence of a fatty acid oxidizing enzyme, preferably a lipoxygenase.

37. The process of any of claims 17 to 35, wherein the (pre-) treatment is carried out in an aqueous slurry at a temperature in the range from 20-105°C, preferably 60-95°C.

5

Abstract

The present invention provides a process of liquefying starch-containing material comprising the step of treating said dry milled starch-containing material with at least one alpha-amylase and a maltogenic amylase or at least one amylase and at least one esterase.

Application Data Sheet

Application Information

Application Type::	Provisional
Subject Matter::	Utility
CD-ROM or CD-R::	None
Sequence Submission::	Paper
Computer Readable Form (CRF)::	No
Title::	LIQUEFACTION PROCESSES
